## WHAT IS A WATER FED POLE?

The Water Fed Pole is a system that uses water deionizing tanks and a pole capable of reaching up to four stories to clean windows. The Water Fed Pole system takes the regular tap water from a building's outside water hook up and runs it through a purification system. In this process, all of the minerals, chemicals and any other pollutants are removed from the water, it is then piped into an extension pole with a brush on the end of it.

The reason for using purified water is that it eliminates the need for a squeegee. As such, it also eliminates the chance of streaks or drips on the glass because the d.i. water dries spot free. When operating the Water Fed Pole, you can safely and efficiently clean the windows while never leaving the ground.
